

FEELSWARM PRODUCT CONTROLS

THERMAL CONTROLLER

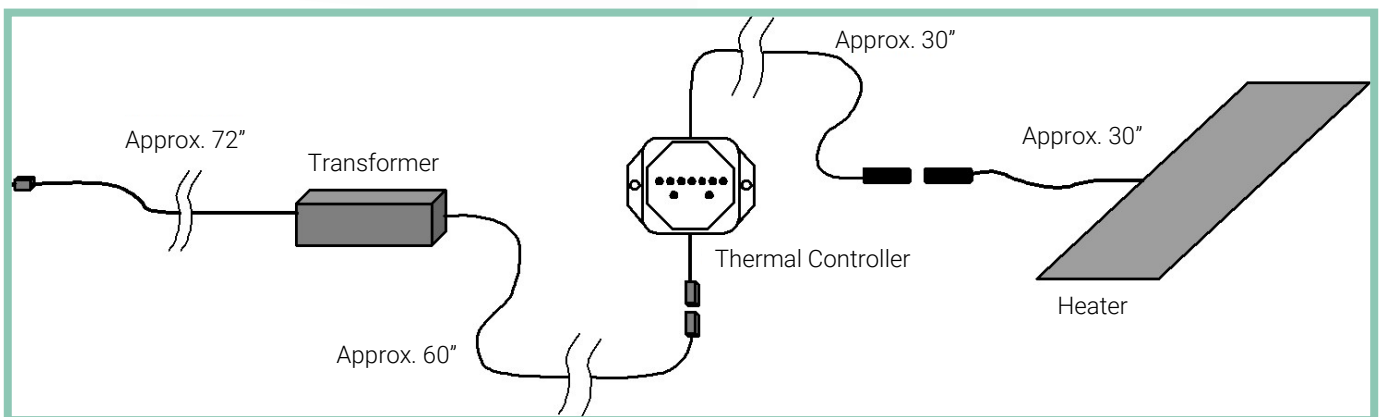

TRANSFORMER

The control of the FeelsWarm countertop warmer is simple. When plugged into 120V household power, it is designed to raise the stone temperature 20°F, enough to remove the cold feel of the surface without providing too much warmth.

Included with each FeelsWarm mat is a low-voltage power transformer (6-24 volts depending upon size) that plugs into a standard outlet to power the heater. At most, the transformer will draw 2.2 amps and does not require any special wiring.

A Thermal Controller is available as an optional add-on item which enables the user to lower the temperature of the counter if desired and to quickly turn the unit on/off.

It is most common for homeowners to leave the heating mat running at all times. Therefore, the transformer and controller are typically installed within a cabinet or in a non-visible position.

Our Surface-Prep Epoxy Kit is included with each mat and is needed if the underside of your stone is not smooth granite (any quartz, marble, wood, rough granite and other surfaces where pressure sensitive tape does not bond well). Installation accessories are also included to mount the controls inside of the cabinetry.
